                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MILLARITY).

DOMAIN: TWO GLOBULAR DOMAINS, G1 AND G2, COMPRISE THE AMINO TERMINGS OF THE PROTEOGLYCAN, WHILE ANOTHER GLOBULAR REGION, G3, MAKES UP THE COOH TERMINUS. G1 CONTAINS LINK DOMAINS AND THUS CONSIGYS OF THREE DISULFIDE-BONDED LOOP STRUCTURES DESIGNATED AS THE A, B, B' MOTIFS. G2 IS SIMILAR TO G1. THE KERATAN SULFATE (KS) AND THE CHONDROITIN SULFATE (CS) ATTACHMENT DOMAINS LIE BETWEEN G3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PTM: CONTAINS MOSTLY CHONDROITIN SULFATE, BUT ALSO KERATAN SULFATE CHAINS, N-LINKED AND O-LINKED OLIGOSACCHARIDES.

DISEASE: DEFECTS IN AGC1 ARE THE CAUSE OF CARTILAGE MATRIX DEFICIENCY (CMD), AN AUTOSOMAL RECESSIVE SYNDROME CHARACTERIZED BY CLEFT PALATE, SHORT LIMBS, TAIL AND SNOUT. MUTATION IN STRAIN CMD CAUSES ABSENCE OF AGGRECAN BY TRUNCATION OF THE PROTEIN (MUTATION IN THE G1 DOMAIN).
                                                                                                                                                                                                                                                                                                                                                                                                      the aggreean gene.";
Nat. Genet. 7:154-157(1994).

INAT. Genet. 7:154-157(1994).

INAT. BY CHARTINGENOGENTRAN IS A MAJOR COMPONENT OF EXTRACELLULAR MATRIX OF CARTILAGENOUS TISSUES. A MAJOR FUNCTION OF THIS PROTEIN IS TO RESIST COMPRESSION IN CARTILAGE. IT BINDS AVIDLY TO HALDRONIC ACID VIA AN AMINO-TERMINAL GLOBULAR REGION. MAY PLAY REGULATORY ROLE IN THE MATRIX ASSEMBLY OF THE CARTILAGE.

Inhibition of Igal proteinases from Neisseria gonorrhoeae and Hemophilus influenzae by peptide prolyl boronic acids.";

J. Biol. Chem. 265:3738-3743(1990).

-I- FUNCTION: THIS PROTEASE IS SPECIFIC FOR IMMUNOGLOBULIN A.

-CATALYTIC ACTIVITY: CLEANAGE OF IMMUNOGLOBULIN A MOLECULES AT CERTAIN PRO-I-XAA BODDS IN THE HINGE REGION. NO SMALL MOLECULE SUBSTRATES ARE KNOWN.
                                                                                                                                                                                  476 VAADP--GYSVIQNFSGSGPVTGRLIGTPGQGIQSTYALL------ANSGGLRLG

Escherichia coli (EBEC) strain. The sequence was deduced from an isolated tir polynucleotide (see AAX58859). Tir proteins are secreted by attaching and effacing pathogens such as EBEC and EPEC (see AAX6820). Tir proteins are secreted by attaching and effacing pathogens such as EBEC and EPEC (see AAX06220) E. coli. The bacterial pathogens insert their own receptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host signaling events and actin nucleation. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the performed by use of nucleic acids recombinant method for producing recombinant Tir, peptides, a recombinant method for producing recombinant Tir, and a kit for the detection of nucleic articles which bind to Tir, and a kit for the detection of nucleic articles which bind to Tir, and a kit for the detection of nucleic atth Tir to induce a protein embuse a provided. The detection of nucleic acids of a nucleic acids and the tir to induce a protein scan be used in attendated E. coli in addition, Tir fusion proteins can be used in attendated E. coli in addition, the hinding of bacterial pathogens to their RINGIQISVVXSTIQHPRDTTDNQARLLGNPSAGIQSTVARLALSGGLRHDMGGLTGGS 540 lgnaipsgylkddvvanieeqakaageeakoqaiennaqaqkkydeoqakroeelkvssg 360 AGYGLSGALILGGGIGVAVTAALHRKNQPVEQTTTTTTTTTTTSARTVENKPANNTPAQG 420 NVDTPGSEDTMESRRSSMASTSSTFFDTSSIGGPCRIRMLMLKHRCMIRRCRLLILIRLF 480 VGQRNGVETSVVLSDQEYARLQSIDPEGKDKFVFTGGRGGAGHAMVTVASDITEARQRIL 180 NRASDVPGLPVNPMRLAASEITLNDGFEVLHDHGPLDTLNRQIGSSVFRVETQEDGKHIA 120 1 MPIGNLGHNPNVNNSIPPAPPLPSQTDGAGGRGQLINSTGPLGSRALFTPVRNSMADSGD 60 **ELLEPKGTGESKGAGESKGVGELRESNSGAENTTETQTSTSTSSLRSDPKLWLALGTVAT** New translocated intimin receptor useful for treating infection by enteropathogenic or enterohemorrhagic Escherichia coli The present sequence represents Tir, a novel translocated intimin receptor (formerly termed Hp90) from an enterohaemorrhagic ; Score 2851; DB 20; ; Pred. The present sequence represents Tir, a novel translocated intimin receptor (formerly termed Hp90) from an enteropathogenic Escherichia coli (EPEC) strain. The sequence was deduced from an isolated tir polynucleotide (see AAX58858). Tir proteins are secreted by attaching and effacing pathogens such as EPEC and EHEC (see AAX06221) E. coli. The bacterial pathogens insert their own creceptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host signaling events and actin nucleation. Diagnosis of disease caused by pathogenic E. coli can nucleation. Diagnosis of antibodies that bind to Tir to detect the protein or the use of antibodies that bind to Tir to detect the protein or the use of antibodies that bind to Tir to detect the ceids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir peptides, a recombinant method for producing recombinant Tir, and a kit for the detection of Tir-producing E. coli are provided. A method of immunising a host with Tir to induce a protective immune response is also provided. In addition, Tir fusion proteins can be used in attenuated E. coli to induce a cell-mediated immune response is also provided. In interfere with the binding of bacterial pathogens to their polypeptides, interfere with the binding of bacterial pathogens to their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New translocated intimin receptor useful for treating infection by enteropathogenic or enterohemorrhagic Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                 "given as Xaa in the specification; Lys is deduced from the DNA sequence"

The present invention describes a method of screening for an inhibitor of intimin pinding to eukaryotic cells. The method comprises exposing an intimin polypeptide having a Thrindependent cell binding activity to test agents, and obtaining an inhibitor based on its ability to bind the polypeptide. The inhibitors are used in the prevention, treatment and/or aliagnosis of bacterial infections, preferably by enteropathic and/or enterobaemorrhagic Escherichia coll, Shiga toxigenic E. coll, Hafnia alore in Citrobacter freudil, Or especially E. coll ol5:HY. The infections cause a histopathological effect known as attachment and effacement on intestinal epithelial cells. The inhibitors can be used to produce food supplements or additives, especially where the food is a milk substitute. The method can be used to sort cells based on their ability to bind to a Tir independent cell binding domain of an intimin polypeptide. Polypeptides having Tir-independent intimin binding call disease. The present sequence represents a specifically claimed intimin cerminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          QALALTPEPDSPTTTDPDAAASATETATRDQLTKEAFQNPDNQKVNIDELGNAIPSGVLK 311

```
receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wood WI

```
The present sequence is a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SDVPGLPVNPMRLAASEITLNDGFEVLHDHGPLDTLNRQIGSSV-FRVETQEDGKHIAVG 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The mutant protease K138N having mew cleavage specificities is obtained by carrying out single amino acid substitutions. This mutant may then be used to prepare hybrid proteases, the fusion being between a type I and a type III protease of L.lactis Wg2 and SK11.

The product has modified properties, e.g. thermostability, alkaline/acid pH stability, oxidative stability, autoproteolysis et compared to the parent protease(s). The proteases can be used for prepared with the aid of lactic acid bacteria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The mutant protease N166D having mew cleavage specificities is obtained by carrying out single amino acid substitutions.

This mutant may then be used to prepare hybrid proteases, the fusion being between a type I and a type III protease of L.lactis Wg2 and SK11.

The product has modified properties, e.g. thermostability, alkaline/acid pH stability, oxidative stability, autoproteolysis etc., compared to the parent protease(s). The proteases can be used for preparing products (butter cheese, human and animal foodstuffs) prepared with the aid of lactic acid bacteria.

obtained by replacing two amino acids. This mutant may then be used to prepare hybrid proteases, the fusion being between a type I and a type III protease of L. Lactis Mq2 and SKII.

The product has modified properties, e.g. thermostability, alkaline/acid pH stability, oxidative stability, autoproteolysis et compared to the parent protease(s). The proteases can be used for preparing products (butter cheese, human and animal foodstuffs) prepared with the aid of lactic acid bacteria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The mutant protease having mew cleavage specificities is obtained by replacing three amino acids.
This mutant may then be used to prepare hybrid proteases, the fusion being between a type I and a type III protease of L.lactis Wg2 and SKll.
The product has modified properties, e.g. thermostability, and alkaline/acid pH stability, oxidative stability, autoproteolysis et compared to the parent protease(s). The proteases can be used for preparing products (butter cheese, human and animal foodstuffs) see also AAQ10411-17 and AAQ10870-71.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant protease gene(s) and protease(s) - derived from type I and III protease genes from lactococcal strains, used in fermentation foodstuffs and flavourings
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        h 5.0%; Score 141.5; DB 12; Length 1962; Similarity 22.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       obtained by replacing three amino acids.
This mutant may then be used to prepare hybrid proteases,
the fusion being between a type I and a type III protease of
L.lactis Mg2 and St1.
The product has modified properties, e.g. thermostability,
alkaline/acid pH stability, oxidative stability, autoproteolysis etc.,
compared to the parent protease(s). The proteases can be used for
preparing products (butter cheese, human and animal foodstuffs)
prepared with the aid of lactic acid bacteria.

                       obtained by carrying out single amino acid substitutions.
This mutant may then be used to prepare hybrid proteases,
the fusion being between a type I and a type III protease of
L.lactis Wg2 and SK11.
The product has modified properties, e.g. thermostability,
alkaline/acid pH stability, oxidative stability, autoproteolysis et
compared to the parent protease(s). The proteases can be used for
preparing products (butter cheese, human and animal foodstuffs)

This mutant may then be used to prepare hybrid proteases,
This mutant may then be used to prepare hybrid proteases,
L.lactis Wg2 and SK11.
The product has modified properties, e.g. thermostability,
alkaline/acid pH stability, oxidative stability, autoproteolysis etc.,
compared to the parent protease(s). The proteases can be used for
preparing products (butter cheese, human and animal foodstuffs)
prepared with the aid of lactic acid bacteria.
